Operational

KIBITZ/VULTURE Development

1. Since [] will be returning to Washington for a 45-day TDY session before going on home leave, it is requested that he be directed to the proper channels to construct a container which will facilitate the use of our VULTURE burial operations. We have been, and are still somewhat handicapped by substituting various metal containers which cannot be hermetically sealed here in the field. On the other hand, it is most inconvenient to ask Washington to prepare our caches for burial as we realize the difficulty in handling, shipping, and ordering special items to be cached in for special cases, etc.

2. We have linked the problem of water-proofing by utilizing the "KASIRA" method explained in HOD-4-35329. Now the problem of re-caching has entered into the picture. Containers manufactured to our specifications back there and shipped to us upon completion would be a definite advantage and could easily be adapted to all field stations connected with PASTIME operations.

3. Due to his connection with the KIBITZ/VULTURE operation, we suggest that [] also be given a familiarization course by the Communications Division with the SS3B-1, RS-1 and the RS-6. This, of course, would only entail a course of instruction for perhaps a two-week period to cover the main over-all function of these radios. Since [] is mechanically learned, we do not foresee much difficulty in this course of instruction.

4. It is also requested that [] return to Germany within this 90-day period due to the critical housing situation. Should he be absent for a longer period of time, he will forfeit his billet which is being held for his return.
